10 years 58,300 yen

## About Umbilical Cord Storage

The umbilical cord connects mother and baby. In recent years, it has been discovered that the umbilical cord contains a large number of mesenchymal stem cells, which are widely studied in the field of regenerative medicine.

Mesenchymal stem cells have an ability to move on to areas of inflammation in the body to soothe inflammation and repair damaged tissue.

StemCell Institute's umbilical cord storage service enables the umbilical cord to be frozen and preserved alive.

By freezing and storing the umbilical cord at the time of delivery, it may make it possible to use it for medical and other purposes for your child and your family.
